Lithium-ion batteries (LiBs) are excellent selection for the energy storage in electric vehicles (EVs) because they have great energy and power density, long lifetime, low self-discharging rate, faster charging capacity, higher capacity and efficiency, etc. [1]. This is because the battery capacity has a significant impact on electric vehicle performance and range [2].

Electric vehicle is an important carrier of renewable energy storage and consumption. As an important part of electric vehicle, the lithium-ion battery (LIB) on-board life is about 5-8 years [1]. And the current standard

stipulates that the battery should be retired from electric vehicle when its capacity decays to about 80% of the initial capacity [2], [3].
