The types and uses of energy had been dynamically changing in history because Beltran (2018) regarded energy as a living, evolving, and reactive system, which remained an integral part of civilizations and their development. The sun was the only source of heat and light while wood, straw and dried dung were also burnt.

The storage of thermal energy is possible by changing the temperature of the storage medium by heating or cooling it. This allows the stored energy to be used at a later stage for various purposes (heating and cooling, waste heat recovery or power generation) in both buildings and industrial processes.
