tery storage systems to PV power plants for due to lower costs. These involve two or more energy systems (PV and storage systems or only storage systems) working separately from one another on the DC side. The energy paths are then coupled together on the AC side upstream of the connection to the medium-voltage grid /

In large-scale photovoltaic (PV) power plants, the integration of a battery energy storage system (BESS) permits a more flexible operation, allowing the plant to support grid stability.

Previously many projects built the renewable generation first and only added storage later. In these cases, AC coupling often works best. "The current trend is to pair renewables and energy storage simultaneously, because energy storage is needed to capture the excess energy of renewables," says van Butselaar.

To fill this gap, this paper proposes a dual-port grid forming inverters control method, so that the MMC can stably form the ac-side frequency and dc-side voltage even with the unbalanced energy storages embedded in sub-modules. The simulation waveforms are given to verify the error-free features and unbalanced operation of the proposed method.
