What is the difference between rated power capacity and storage duration?

Rated power capacity is the total possible instantaneous discharge capability of a battery energy storage system (BESS), or the maximum rate of discharge it can achieve starting from a fully charged state. Storage duration, on the other hand, is the amount of time the BESS can discharge at its power capacity before depleting its energy capacity.

Independently of these considerations, the ability of storage technologies to act as a "shock absorber" for the electricity infrastructure, thus enhancing its efficiency, reliability and security, is an important asset for the future electricity network: "by maintaining even a relatively modest amount of reserves, storage facilities ...

Instead, the appropriate amount of grid-scale battery storage depends on system-specific characteristics, including: The hourly, daily, and seasonal profile of current and ...

The amount of energy stored,  $E$ , is proportional to the mass of the flywheel and to the square of its angular velocity is calculated by means of the equation (1)  $E = \frac{1}{2} I \omega^2$  where  $I$  is the moment of inertia of the flywheel and  $\omega$  is the angular velocity. The maximum stored energy is ultimately limited by the tensile strength of the flywheel material.
