

Application of potassium carbonate energy storage

Can potassium carbonate be used in heat storage applications?

In this study, the use of potassium carbonate in heat storage applications is investigated experimentally. The most important objective is to form a kinetic model for the de/re-hydration reaction of the material. In order to do so, it is crucial to understand the behavior of the salt when it reacts with water vapor.

Can potassium carbonate be used as thermochemical heat storage in salt hydrates?

Thermochemical heat storage in salt hydrates is a promising method to improve the solar fraction in the built environment. One of the most promising salt hydrates to be used as thermochemical material is potassium carbonate. In this study, the use of potassium carbonate in heat storage applications is investigated experimentally.

Can potassium carbonate be used as a thermochemical material?

One of the most promising salt hydrates to be used as thermochemical material is potassium carbonate. In this study, the use of potassium carbonate in heat storage applications is investigated experimentally. The most important objective is to form a kinetic model for the de/re-hydration reaction of the material.

Is potassium carbonate a suitable material for exothermic hydration?

Potassium carbonate (K_2CO_3) is one of the potential candidate materials to efficiently store thermal energy due to its high heat storage capacity and cost-effectiveness. In the present study, a 3-dimensional numerical model is developed for the exothermic hydration reaction of K_2CO_3 .

Is K_2CO_3 a good thermochemical heat storage material?

Fabricated composites made up of K_2CO_3 , EG, and OP-10 are developed. Sorption kinetic and water uptake are improved. Heat and mass transfer are enhanced. Salt hydrates are ideal for long-term thermochemical heat storage in a built environment, where K_2CO_3 is considered a promising thermochemical heat storage material.

Application of potassium carbonate energy storage

Potassium carbonate faces obstacles in practical application due to several factors. Firstly, its hydration reaction is diffusion-limited, which may result in incomplete hydration (Gaeini et al. 2019; Fisher et al. 2021). Secondly, under conditions of low humidity or low vapor pressure, K_2CO_3 may enter metastable states, impeding hydration due to nucleation ...

A potassium carbonate salt hydrate based Thermochemical Energy Storage System (TESS) suitable for various heating applications encountered in cold ambient conditions is proposed. The hydration-dehydration reaction rate expressions of potassium carbonate salt hydrate are utilized to estimate the reaction times.

Composite PCM with a SA encapsulation rate of 90.6 % is a promising thermal energy storage material. It can be used as a thermal energy storage material for the exterior walls of buildings. It can absorb exterior wall heat and solar radiant heat from the surrounding air during the day and release exterior wall heat into the surrounding air at ...

An interesting material for thermochemical heat storage should be non-toxic, non-corrosive and stable with high energy storage density [4] addition, the price of the material is a crucial factor affecting the economic feasibility of a heat storage system [14]. More specifically, depending on the application, operating boundary conditions are important [5], such as ...

Potassium carbonate has recently been identified as a promising candidate for thermochemical energy storage. However, as for many salt hydrates, its reaction kinetics is relatively slow. K_2CO_3 has a metastable zone, where the reaction is kinetically hindered, which limits the temperature operating window. This work aims to improve the ...

The application of thermal energy storage using thermochemical heat storage materials is a promising approach to enhance solar energy utilization in the built environment.
