Which energy storage technologies are most efficient?

Currently, the existing large-scale energy storage technologies include pumped hydro energy storage (PHES), geothermal, hydrogen, and compressed air energy storage (CAES) [1, 2, 3, 4]. However, only PHES and CAES demonstrate economic efficiency in large-scale, high-power operation conditions.

Does a larger cavern radius reduce air leakage?

However, a larger cavern radius requires higher stability and increases the difficulty of construction. This indicates that a proper selection of cavern radius can reduce the air leakage rate from concrete lining caverns.

How can a cavern reduce air leakage?

The daily air leakage rate can be reduced by modestly increasing the cavern radius, lowering the temperature of the injected air, and decreasing the maximum operating pressure. These results can provide a reference for the study and construction of CAES caverns in similar projects.

Does concrete lining permeability affect airtightness of CAES caverns?

Hence, the concrete lining permeability is a major factor affecting the airtightness of CAES caverns. To satisfy the sealing requirement, the corresponding concrete permeability should not exceed $1 \times 10^{-19} \text{ m}^2$ at an operating pressure of 4.5-10 MPa. Fig. 16. Influence of concrete lining permeability on air leakage. 5.3.2.

How long does air seepage last in a concrete lining?

In the first day, the air seepage distance is short that it does not exceed the thickness of the concrete lining. Before the seepage distance reaches 0.5 m, the pore pressure gradient already equals 0 and the air stops seeping. After 20 days of operation, the air seepage distance increases to 5 m.

What happens if air seepage distance exceeds a concrete lining?

When the distance exceeds the thickness of the lining, the variation of pore pressure slows down apparently and finally stabilizes. In the first day, the air seepage distance is short that it does not exceed the thickness of the concrete lining.

Alongside Pumped Hydroelectric Storage (PHS), Compressed Air Energy Storage (CAES) is one of the commercialized EES technologies in large-scale available. Furthermore, the new advances in adiabatic CAES integrated with renewable energy power generation can provide a promising approach to achieving low-carbon targets. The small-scale CAES ...

are both successfully implemented in salt caverns [281]. Therefore, large-scale energy storage in salt caverns will also be enormously developed to deal with the intermittent and fluctuations of renewable sources at the national or grid-scale.

Compressed air energy storage systems may be efficient in storing unused energy, but large-scale applications have greater heat losses because the compression of air creates heat, meaning expansion is used to ensure the heat is removed [[46], [47]]. Expansion entails a change in the shape of the material due to a change in temperature.

The difference is that hydrogen and synthetic methane are utilized as energy carriers rather than compressed air. Currently, hydrogen energy storage is largely taking place as small-scale experiments and controlled demonstrations, while large-scale storage is still quite conceptual (Ozarlsan, 2012; Zanuttigh et al., 2016).

At present, the types of large-scale energy storage system in commercial operation have only pumped hydro energy storage (PHES) plants and compressed air energy storage (CAES) power plants. Mechanical energy storages, characterized by low energy storage density, is the basic property of PHES and CAES plants [3]. Alternatives are natural gas ...
