Can inductor design achieve high Q at high power and high frequency?

Simulations of an example inductor support that the modified dumbbell geometry and guidelines can achieve high Q at high power and high frequency. The developed design techniques and proposed inductor structures are therefore suitable for achieving low-loss HF inductor designs for a potentially wide range of applications.

How do you calculate the stored energy of an inductor?

It can be determined by the following calculation: Inductors store energy. The stored energy of an inductor is: $W = \frac{1}{2} LI^2$. This energy is stored as magnetic field energy, within the ferrite core and within the air gap (see Fig.5.1.1). The higher the required stored energy, the larger the required core.

What is the difference between inductors and high frequency transformers?

Calculation of Inductors Design of Inductors and High Frequency Transformers Inductors store energy, transformers transfer energy. This is the prime difference. The magnetic cores are significantly different for inductors and high frequency transformers.

Can high frequency inductors miniaturize power electronics?

Operation in the high frequency (HF) regime (30-300 MHz) has potential for miniaturizing power electronics, but designing small, efficient inductors at HF can be challenging. At these frequencies, losses due to skin and proximity effects are difficult to reduce, and gaps needed to keep B fields low in the core add fringing field loss.

When is inductor efficiency highest?

Inductor efficiency is highest when the combination of core and winding losses are the lowest. Therefore, the goal of highest efficiency is met by selecting an inductor that provides sufficient inductance to smooth out the ripple current while simultaneously minimizing losses.

Can 600 nH inductor be used for high-frequency miniaturization of power electronics?

Simulations show that an example 600 nH inductor achieves a quality factor of 1900 at 13.56 MHz and 78 A (peak). Therefore, the developed design techniques and inductor structures are suitable for small, highly-efficient inductors at HF, and can thereby help realize high-frequency miniaturization of power electronics.
