What is the energy platform & why is it important?

The energy platform also requires breakthroughs in large scale energy storage and many other areas including efficient power electronics, sensors and controls, new mathematical and computational tools, and deep integration of energy technologies and information sciences to control and stabilize such complex chaotic systems.

1. Introduction

How do you categorize energy storage services?

Another approach for categorizing storage services is by the governing rate tariff or market rules. This results in three categories: behind-the-meter (BTM) applications, front-of-the-meter (FTM) applications (e.g., market areas), and operation in a vertically integrated utility. A summary of energy storage applications is given in Table 1.

How to implement the energy platform?

In order to implement the energy platform, there is significant work to develop enabling technologies such as energy storage, power electronics, and mathematical and computing tools. Control and optimization of a large number of devices and players to ensure system-level performance also requires a large and sustained effort.

How can big data industrial parks improve energy storage business model?

Combined with the energy storage application scenarios of big data industrial parks, the collaborative modes among different entities are sorted out based on the zero-carbon target path, and the maximum economic value of the energy storage business model is brought into play through certain collaborative measures.

What are energy storage systems?

Energy storage systems (ESSs), with the ability to alternatively charge and discharge energy, can provide a wide range of grid services [2,3] to tackle the above challenges. There are several ways to categorize these services. A common method is based on the time scale of the charge/discharge cycle.

What is a platform based approach?

A platform-based approach, called the energy platform, is investigated. The energy platform consists of the hardware and software to generate, store, control and transmit electricity/data, the digital platform to share and manage the infrastructure, and the transaction platform for service and trade.
