Why do we need battery energy storage systems?

Battery energy storage systems (BESS) have become a solution to prevent surpluses from being lost and to cover the intermittence of renewable energy. "We need energy storage solutions to make them permanent," says researcher and electric battery expert Philippe Knauth in an interview for [bbva.com](https://www.bbva.com).

How do batteries store electricity?

Batteries and similar devices accept, store, and release electricity on demand. They use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.

How are batteries used for grid energy storage?

Batteries are increasingly being used for grid energy storage to balance supply and demand, integrate renewable energy sources, and enhance grid stability. Large-scale battery storage systems, such as Tesla's Powerpack and Powerwall, are being deployed in various regions to support grid operations and provide backup power during outages.

What is the main method batteries use to store energy?

Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. They accept, store, and release electricity on demand.

Why do we need batteries?

Batteries play a crucial role in integrating renewable energy sources like solar and wind into the grid. By storing excess energy generated during periods of high production and releasing it during periods of low production, batteries help mitigate the intermittency of renewables and ensure a stable energy supply.
