#### How much energy do you need to boil a mL of water?

In our kitchen, we need to get those 500 mL of water from room temperature (21C) to boiling (100C) by adding energy - 165,000 Joules (or 0.046 kilowatt hours), to be precise - in the form of heat. Remember, energy comes in many forms: heat, electricity, food calories, nuclear energy, electromagnetic energy (light), etc.

#### How does boiling water work?

Boiling water is big business: Coal, natural gas and concentrating solar power plants all work by turning water into steam, and using that steam to generate electricity. "Engineers have been working on making that process more efficient for well over 100 years," Williams said.

#### Why is boiling water important?

A cup of tea is nice, but boiling water has a much bigger role: It's the main way we generate electricity. Power plants - nuclear, coal, natural gas, petroleum, concentrating solar - all rely on steam to generate electricity. And to do that, they've got to bring water to a boil and beyond.

How do you get 500 ml of water from room temperature to boiling?

To heat 500 ml of water from room temperature (21°C) to boiling (100°C),you need to add 165,000 Joules (or 0.046 kilowatt hours) of energy in the form of heat in the kitchen.

What does boiling mean in a kitchen?

Before we get to your kitchen, let's review exactly what boiling means: Boiling is when water goes from a liquid to a gas. At sea level and standard air pressure, we have to heat water to 212 degrees Fahrenheit (or 100 degrees Celsius) before it boils.

#### Are your boiling habits more important than your choice of appliance?

When it comes to energy efficiency, your boiling habits are more important than your choice of appliance. Or, as Tom Williams puts it, "As soon as humans can interact with something, we mess it up." We often boil more water than we need, using more energy than we need.
