How does reusing a lithium-ion battery affect the environment?

Reusing and recycling solve various issues, including raw material shortages and rising costs. This review covers recycling technology, legal frameworks, economic and environmental advantages, and OEM views on used battery management. Life Cycle Analysis depicts recycling lithium-ion batteries tend to be cost effective and environment sound.

Why is lithium-ion battery recycling important?

The environmental and economic considerations associated with lithium-ion battery recycling emphasize the need to address environmental impacts, conduct life cycle assessments, evaluate economic feasibility, and explore job creation and resource recovery potential.

Why are lithium-ion batteries a problem?

To address the rapidly growing demand for energy storage and power sources, large quantities of lithium-ion batteries (LIBs) have been manufactured, leading to severe shortages of lithium and cobalt resources. Retired lithium-ion batteries are rich in metal, which easily causes environmental hazards and resource scarcity problems.

Are lithium-ion batteries sustainable?

However, the sustainability concerns of lithium-ion batteries (LIBs) and next-generation rechargeable batteries have received little attention. Recycling plays an important role in the overall sustainability of future batteries and is affected by battery attributes including environmental hazards and the value of their constituent resources.

Should lithium-ion batteries be recycled?

Based on the results of Life Cycle Assessment (LCA), recycling lithium-ion batteries is usually a good financial and ecological decision. Although pyrometallurgy and hydrometallurgy are technologically more advanced, direct physical and biometallurgical recycling is preferable from an economic and environmental perspective.

Why is a lithium ion battery a good material?

These materials have both high ionic conductivity and good (electro)chemical stability, which are crucial for reliable battery performance. By adjusting the structure of the materials, the researchers have improved lithium-ion transport and the interface between the electrolyte and other battery components.
