The emerging cloud computing model facilitates access to computing resources for end users through the internet. Cloud computing is a model that enables on-demand access to the shared pool of customizable computing resources (e.g. servers, storage, networks, and applications) and services (Mell and Grance, 2011).

While dynamic energy management (DEM) in conventional electricity grids is a well-investigated topic, this is not the case for SGs. This is due to its much more complicated nature, since complex decision-making processes are required by the control centers [4], [5]. Energy management systems (EMSs) in SGs include i) real-time wide-area situational awareness ...
