

Current energy storage mode for electric buses

Can energy storage systems improve bus charging and transit center energy management?

The widespread use of energy storage systems in electric bus transit centers presents new opportunities and challenges for bus charging and transit center energy management. A unified optimization model is proposed to jointly optimize the bus charging plan and energy storage system power profile.

Can a bus charging method optimize energy storage systems in seconds?

The numerical simulations demonstrate that the proposed method can optimize the bus charging time, charging power, and power profile of energy storage systems in seconds. Monte Carlo simulations reveal that the proposed method significantly reduces the cost and has sufficient robustness to uncertain fluctuations in photovoltaics and office loads.

What are bus energy consumption models?

Bus energy consumption models have been developed using at least three classes of methods. The first is physics-based methods that model vehicle-specific power required for a bus to travel at a certain speed, working against gravity, rolling resistance and air resistance 17.

Are energy management issues a common thread in electric bus research?

In a recent review, Manzolli et al. found that such energy management issues are a common thread across electric bus research, intersecting with major topics of sustainability, vehicle technology, battery technology, and fleet operation 11.

Why do energy buses need a grid connection?

This is intrinsically connected to the difficulty in determining how much energy buses will consume on a certain route in specific weather and traffic conditions, which influences both the charging equipment and grid connection capacity required to facilitate sufficient charging of the buses to meet their scheduled routes.

Can a data-driven predictive model be used for electric bus energy consumption?

To develop a data-driven predictive model for electric bus energy consumption a training dataset of bus trips was required. Where for each trip the input (independent) and output (dependent) parameters wishing to be modelled are recorded.
