Design of three-dimensional structure for electrochemical energy storage

Can three-dimensional ordered porous materials improve electrochemical storage of energy?

Three-dimensional ordered porous materials can improve he electrochemical storage of energy. Jing Wang and Yuping Wu from Nanjing Tech University, China and co-workers review the development of these materials for use as electrodes in devices such as batteries and supercapacitors.

What are 3D polymer based solid-state electrochemical energy storage devices?

Here, we review recent advances in 3D polymer based solid-state electrochemical energy storage devices (mainly in SSCs and ASSLIBs), including the 3D electrode (cathode, anode and binder) and electrolyte (as shown in Fig. 1).

What is electrochemical energy storage?

Among various energy storage technologies, electrochemical energy storage devices are the most promising and common. Currently, research on electrochemical energy storage is mainly focused on supercapacitors and rechargeable batteries.

What are the main focuses of electrochemical energy storage research?

Currently, research on electrochemical energy storage is mainly focused on supercapacitors and rechargeable batteries 1,2,3,4,5. Among various energy storage technologies, electrochemical energy storage devices are the most promising and common devices.

Can 3D printed functional nanomaterials be used for electrochemical energy storage?

Zhu, C. et al. 3D printed functional nanomaterials for electrochemical energy storage. Nano Today 15, 107-120 (2017). This review article summarizes progress in fabricating 3D electrodes via 3D printing techniques. Zhu, C. et al. Supercapacitors based on three-dimensional hierarchical graphene aerogels with periodic macropores.

What are three-dimensional (3D) polymers?

Three-dimensional (3D) polymers, an emerging class of organic materials consisting of pure polymers or polymer composites, possessing interconnected 3D networks and highly continuous porous structure, could be utilized in both electrodes and electrolytes of SSCs and ASSLIBs.

Owing to the lack of non-renewable energy and the deterioration of the global environment, the exploration and expansion of cost-effective and environmentally-friendly equipment for energy conversion/storage has attracted more attention [[1], [2], [3]]. With the remarkable achievements of social science and the rapid development of human technology, ...

The original three-dimensional porous structure is retained even after cycling rates, leading to the selection of this line width and spacing for the 3D printed electrodes. Subsequently, post-processing treatments such as

Design of three-dimensional structure for electrochemical energy storage

direct freezing and unidirectional ice-templating were employed to fabricate random-channel 3D printed (R-3DP) electrodes ...

The advancement of next-generation energy technologies calls for rationally designed and fabricated electrode materials that have desirable structures and satisfactory performance. Three-dimensional (3D) self-supported amorphous nanomaterials have attracted great enthusiasm as the cornerstone for building high-performance nanodevices. In particular, ...

select article Advances and perspectives of ZIFs-based materials for electrochemical energy storage: Design of synthesis and crystal structure, evolution of mechanisms and electrochemical performance ... Core-shell structure nanofibers-ceramic nanowires based composite electrolytes with high Li transference number for high-performance all-solid ...

We report the design of a three-dimensional (3D) holey-graphene/niobia (Nb 2 O 5) composite for ultrahigh-rate energy storage at practical levels of mass loading (>10 milligrams per square centimeter). The ...

Recently, the three-dimensional (3D) printing of solid-state electrochemical energy storage (EES) devices has attracted extensive interests. By enabling the fabrication of well ...

The structure of porous AAO template can be described as a close-packed hexagonal array of parallel cylindrical nanochannels like honeycombs, ranging from 10 to 400 nm in diameter [20], [27], [28]. The formation of the highly ordered hexagonal pore arrays is a self-organization process during the Al anodization [28], [29], [30], by controlling anodization ...

Progress and challenges in electrochemical energy storage devices: Fabrication, electrode material, and economic aspects ... (NPs), three-dimensional (3D), two-dimensional (2D), one-dimensional (1D), Zero ... They reported that metal oxides and chalcogenides can be used in the porous network structure of MOFs to improve the electrochemical ...

Graphene is a crystalline allotrope of carbon with a 2D structure. Experimental results have shown that the electron mobility in graphene at room temperature is in excess of 15,000 cm 2 /V s, and moreover, the hole mobility is almost the same. The electrons in graphene can cover micrometer distances without being scattered, even at room temperature.

Abstract. Electrochemical energy storage has been instrumental for the technological evolution of human societies in the 20th century and still plays an important role nowadays. In this introductory chapter, we discuss the most important aspect of this kind of energy storage from a historical perspective also introducing definitions and briefly examining the most relevant topics of ...

Design of three-dimensional structure for electrochemical energy storage

In this paper, we introduce a density-based topology optimization framework to design porous electrodes for maximum energy storage. We simulate the full cell with a model that incorporates electronic potential, ionic potential, and electrolyte concentration. The system consists of three materials, namely pure liquid electrolyte and the porous solids of the anode ...

ConspectusThree dimensional (3D) carbon nanomaterials exhibit great application potential in environmental protection, electrochemical energy storage and conversion, catalysis, polymer science, and advanced sensors ...

However, energy storage systems fabricated from organic polymer networks have just emerged as a new prospect. 3D polymer is a category of pure polymer or composites featuring three-dimensional frameworks structure, which could be potentially used in solid-state electrochemical energy storage due to its high electron conductivity or ionic ...

Three-dimensional (3D) printing, as an emerging advanced manufacturing technology in rapid prototyping of 3D microstructures, can fabricate interdigital EES devices ...

However, recent developments in design and optimization of three-dimensional (3D) microbatteries can achieve both high energy density and power concurrently while maintaining minimal spatial footprints. 3, 4 In a 3D microbattery, energy density and power are decoupled, as both can be simultaneously augmented by increasing 3D-structure height ...

Three-dimensional (3D) graphene structure, with the properties of high electrical conductivity, improved structural stability, low density, high porosity, and large surface area, could largely eliminate the aforementioned issues. ... the usage of a RepRap FDM printer for construction of electrochemical energy storage architectures by a graphene ...

For electrochemical energy storage devices, the electrode material is the key factor to determine their charge storage capacity. Research shows that the traditional powder electrode with active material coating is high in production cost, low in utilization rate of the active material, has short service life and other defects. 4 Therefore, the key to develop ...

Their energy storage performance, such as discharge energy density (U e) and charge-discharge energy efficiency (i), can be significantly improved through the rational design of the composition, structure, and surface properties of ceramic fillers embedded in PVDF-based matrix. In the review, we summarize recent developments on PVDF-based ...

Design criteria and opportunities: Overall, Li-O 2 batteries show promise for providing high-capacity energy storage to meet future energy consumption needs, and MOFs are outstanding materials to ...

Design of three-dimensional structure for electrochemical energy storage

Three-dimensional (3D) carbon-based materials are emerging as promising electrode candidates for energy storage devices. In comparison to the 1D and 2D structures, 3D morphology offers new opportunities in rational design and synthesis of novel architectures tailor-made for promoting electrochemical performance.

Three types of TiO 2 have been well investigated, namely, TiO 2(B), anatase, and rutile. Among them, the rutile phase of TiO 2 is the most common natural form since it is the most thermodynamically ...

2D carbon nanosheets have high specific surface area, excellent in-plane conductivity, and fully exposed active sites, making them one of the potential electrochemical energy storage materials. Lignin has a three-dimensional hyperbranched structure, and it is not easy to obtain carbon nanosheets.

Wood has a natural three-dimensional porous skeleton structure, which can be used in the research of energy storage devices. Shan et al. comprehensively discuss the synthetic methods of various electrochemical ...

Three-dimensional (3D) carbon-based materials are emerging as promising electrode candidates for energy storage devices. In comparison to the 1D and 2D structures, ...

However, energy storage systems fabricated from organic polymer networks have just emerged as a new prospect. 3D polymer is a category of pure polymer or composites ...

In recent years, as a flexible electrode material, melamine foam has attracted more and more attention from researchers in the field of wearable energy storage devices. In addition, certain components are loaded on it to improve electrochemical performance and further promote its advantages. Here, we first carbonized commercial melamine foam in N2 ...

Carbon (C) is one of the most abundant elements in the Earth's crust which has been acknowledged for a long time. The conception of carbon materials has aggressively reached an another milestone level from the macro-scale to the nano-scale with the incessant evolution in nanoscience and technology [1] recent advances, the nanostructured carbon materials ...

Among various 3D architectures, the 3D ordered porous (3DOP) structure is highly desirable for constructing high-performance electrode materials in electrochemical energy ...

Before the layered structure design of MXene, different synthesis techniques are needed to prepare MXene with high quality. The intrinsic properties of MXenes are closely related to their synthesis techniques [].Therefore, synthesis conditions can directly influence the layered structure design of MXenes and their properties and energy storage performances.

In this Account, we review recent developments in nanocellulose-based energy storage. Due to the limited space, we will mainly focus on structure design and engineering strategies in macrofiber, paper, and
