Why is optimal configuration of distributed energy storage important?

As an important early stage of energy storage application research, the study of optimal configuration of distributed energy storage in different application scenarios is crucial to its efficient and economical application in power systems.

Why is distributed energy storage important?

This can lead to significant line over-voltage and power flow reversal issues when numerous distributed energy resources (DERs) are connected to the distribution network ,. Incorporation of distributed energy storage can mitigate the instability and economic uncertainty caused by DERs in the distribution network.

How to constrain the capacity power of distributed shared energy storage?

To constrain the capacity power of the distributed shared energy storage, the big-M methodis employed by multiplying U e s s, i p o s (t) by a sufficiently large integer M. (5) P e s s m i n U e s s, i p o s <= P e s s, i m a x <= M U e s s, i p o s E e s s m i n U e s s, i p o s <= E e s s, i m a x <= M U e s s, i p o s

How does a distribution network use energy storage devices?

Case4: The distribution network invests in the energy storage device, which is configured in the DER nodeto assist in improving the level of renewable energy consumption. The energy storage device can only obtain power from the DER and supply power to the distribution network but cannot purchase power from it.

What is the rational planning of energy storage system?

The rational planning of an energy storage system can realize full utilization of energy and reduce the reserve capacity of a distribution network, bringing the large-scale convergence effect of distributed energy storage and improving the power supply security and operation efficiency of a renewable energy power system [11,12,13].

What are the constraints of distributed energy storage?

Furthermore, the power capacity of distributed energy storage must meet the constraint of battery charging rate (C-rate). This means that the ratio of battery power to capacity must be subject to the C-rate constraint.
