and hot water for jacketed heating, and compare indirect and direct steam injection systems for making hot water. In heating applications where processes require operating temperature up to 350°F (177°C) steam is often the first heating medium considered because it is readily available. However, hot water should be given equal consideration ...

Notes: Small-scale studies are recommended to determine the effect of increased temperatures on the free-phase products. These trials will also provide important information for the design of the hot water injection system (injection pressure, water temperature, time of injection, type of injection wells, zone of influence, etc.) and the design of the extraction system.
