How is air storage pressure maintained during charging and discharging?

For IA-CAES, the constant pressure in the air storage device is maintained during the charging and discharging process, as shown in Fig. 7 (c). A constant storage pressure is often achieved by applying a certain depth of water pressure and the air storage device is often constructed underwater.

How does a CAES energy storage system work?

The energy storage part of CAES in general can be distilled into two simple processes: (1) injecting compressed air into a container for storage, and (2) withdrawing that compressed air at a later time to do useful work (i.e., contributing to electrical energy generation in a turbine).
