Could liquid air energy storage be a low-cost alternative?

A new model developed by an MIT-led team shows that liquid air energy storage could be the lowest-cost optionfor ensuring a continuous supply of power on a future grid dominated by carbon-free but intermittent sources of electricity.

How can energy storage help decarbonize power systems?

Energy storage is key to decarbonize power systems by allowing excess renewable energy to be stored and released back to the grid as needed. Ideally, storage should be charged from carbon-free and low-cost renewables and discharged to replace dirty and expensive fossil-fuel generation.

Can energy storage technology help a grid with more renewable power?

Energy storage technologies with longer durations of 10 to 100 h could enable a grid with more renewable power, if the appropriate cost structure and performance--capital costs for power and energy, round-trip efficiency, self-discharge, etc.--can be realized.

What is long duration energy storage (LDEs)?

Long Duration Energy Storage (LDES) is a key option to provide flexibility and reliability in a future decarbonized power system. A variety of mature and nascent LDES technologies hold promise for grid-scale applications, but all face a significant barrier--cost.

Are liquid air energy storage systems economically viable?

"Liquid air energy storage" (LAES) systems have been built, so the technology is technically feasible. Moreover, LAES systems are totally clean and can be sited nearly anywhere, storing vast amounts of electricity for days or longer and delivering it when it's needed. But there haven't been conclusive studies of its economic viability.

Why is energy storage more expensive than alternative technologies?

High capital cost and low energy densitymake the unit cost of energy stored (\$/kWh) more expensive than alternatives technologies. Long duration energy storage traditionally favors technologies with low self-discharge that cost less per unit of energy stored.
