

# Energy calculation of compressed air energy storage

Where will compressed air be stored?

In a Compressed Air Energy Storage system, the compressed air is stored in an underground aquifer. Wind energy is used to compress the air, along with available off-peak power. The plant configuration is for 200MW of CAES generating capacity, with 100MW of wind energy.

How is energy stored in a low demand space?

In low demand periods, energy is stored by compressing air in an air tight space (typically 4.0~8.0 MPa) such as an underground storage cavern. To store energy, air is compressed and sealed in the space. To extract the stored energy, compressed air is drawn from the storage vessel, mixed with fuel, and then combusted. The expanded air is then passed through a turbine.

Does compressed air energy storage improve the profitability of existing power plants?

The use of Compressed Air Energy Storage (CAES) improves the profitability of existing Simple Cycle, Combined Cycle, Wind Energy, and Landfill Gas Power Plants. Nakhamkin, M. and Chiruvolu, M. (2007). Available Compressed Air Energy Storage (CAES) Plant Concepts. In: Power-Gen International, Minnesota.

How much power can a 60 MW compressor produce?

The 60 MW compressor in this Compressed Air Energy Storage system produces 60 MW of power. At full load, the plant can generate 290 MW for two hours.

How much energy does an air engine use?

Thus: a system where we heat the air for an air engine (heat added to keep it isothermal) - 1.5kWh is the available energy. A 33% efficient air engine gets us 500Whr. This is not bad, worth pursuing. Essentially: 1/2kWhr of storage for a \$300 tank cost. This paper shows 70% efficient engines.

How much power does an air compressor consume?

To calculate the power consumption of an air compressor, we use specific power (like a gas-mileage rating). For a 30 cfm air motor requiring 1 hp, the air compressor will consume 7.5 kW, which is about 10 times the motor power output.
