

Are PCM microcapsules suitable for thermal energy storage?

In this paper, a comprehensive review has been carried out on PCM microcapsules for thermal energy storage. Five aspects have been discussed in this review: classification of PCMs, encapsulation shell materials, microencapsulation techniques, PCM microcapsules' characterizations, and thermal applications.

What is a spherical capsule filled with?

In Case A, the spherical capsule is filled with pure PCM. During the period from 0 to 1600 s, the melting process is in stage (I). The heat transfer inside the spherical capsule is governed by the thermal conduction of pure PCM.

Which spherical capsule is the most cost-effective?

Conclusion The current work evaluated and optimized the geometry and usage of porous media inside spherical capsules. Case F, which features a spherical capsule with a copper foam geometric shape in the form of a high cone, presents the most cost-effective option, effectively balancing melting rate and material cost among Case A-F.

Are spherical microcapsules good thermal energy storage and photoluminescence?

These 1.5-2 mm spherical microcapsules showed the characteristics of thermal energy storage and photoluminescence. Additionally, the synthesized microcapsules possessed good thermal reliability, with the thermal property remaining almost unchanged after 100 thermal cycles.

How is heat transferred inside a spherical capsule?

The heat transfer inside the spherical capsule is governed by the thermal conduction of pure PCM. As the average melting fraction $(B(T)_{avg})$ increases, natural convection starts to intensify, resulting in an accelerated melting rate. At this stage (II), natural convection becomes the dominant mode of heat transfer within the capsule.

Is a partially filled spherical capsule effective?

The economic assessment of these initial cases and the optimized cases is also conducted to evaluate the economic feasibility. The numerical results indicate the partially filled strategy is effective and the optimal design is the spherical capsule with a copper foam geometric shape that resembles a high cone with a prominent center.

The advancement and propagation of renewable energy have emerged as pivotal strategies in the pursuit of the dual carbon objective [1]. Solar energy, distinguished as a primary renewable energy source [2], confronts challenges pertaining to its inherent volatility and intermittency [3]. Consequently, the adoption of phase change materials (PCMs) for thermal ...

Latent heat thermal energy storage (LHTES) captures the thermal energy via a solid-liquid phase transition

that occurs in phase-change materials (PCM). The PCM is usually encapsulated in some way. In this study, we consider PCM melting in a vertical cylindrical enclosure, that is a prototype of a capsule used in a future storage system.

This paper is aimed at analyzing the melting behavior of paraffin wax as a phase change material (PCM) encapsulated in a cylindrical capsule, used in a latent heat thermal energy storage system with a solar water heating collector. The heat for melting of PCM in the capsule is provided by hot water surrounding it. Since it is observed experimentally that the phase ...

Ettouney et al. [13] studied the performance of PCM energy storage in spherical capsules. This was made as a function of the HTF temperature, HTF velocity and capsule diameter. The study focused on correlating the Nusselt and Fourier numbers during the melting and solidification modes. The results showed limited effects of natural convection ...

In this paper, the characteristics of a thermal energy storage capsule, using PCM composed of a mixture of a sodium sulfate water solution and a gelled material to prevent the separation of the produced crystal, are discussed analytically and experimentally. Decahydrate of a monoclinic system, called Glauber's salt, appears in the sodium ...

However, due to the certain thickness of the capsule shell, the use of small-scale capsules seriously weakens the energy storage density. Besides, small-scale capsules will also increase the undercooling degree of heat release process of PCMs and further reduce the performance of the heat storage system [30].

During initial part of the energy storage cycle, the body of remaining solid phase fraction is kept on a vertical stem protruding inside into the capsule centre. Later this solid body falls down to the capsule bottom, agitating the internal liquid phase and dramatically changing the topology of the problem.

Bansal and Buddhi (1992) theoretically studied a cylindrical latent heat storage system for a domestic hot water system where during the charging mode of the phase change material, the cylindrical capsule is in the closed loop with a solar water heater, and during the discharging mode, the energy is extracted by a liquid flowing through the ...

This clearly demonstrates the correlation between the increase in energy storage and the size of the capsule. Fig. 8 (b) represents the 3D surface plot for energy storage between the parameters of bath temperature and volume of the capsule. For the bath temperature of $-6\text{ }^{\circ}\text{C}$ and 50, 75 and 100 % PCM volume are 29.95, 66.04 and 103.30 kJ.
