

What is thermal energy storage with microencapsulated phase change materials?

Thermal energy storage with microencapsulated phase change materials is a very successful approach due to its capacity to store large amounts of solar thermal energy, simple synthesis process, improved thermal conductivity, wide operating temperature range, and the great possibility of clean energy storage and supply and so on.

How is oil in water emulsion prepared?

In the first step, oil in water emulsion is prepared with a phase change material using a suitable surfactant. In the second step, the melamine-formaldehyde prepolymer is prepared in an aqueous phase using melamine and formaldehyde as monomers.

How does temperature affect the thermal conductivity of an emulsion?

The graph shows that thermal conductivity of the emulsion increases with rising temperature. On the other hand, a large drop in thermal conductivity was seen near 27 °C regardless of the emulsion concentration.

Why is emulsion polymerization a popular encapsulation method for Poly(Styrene) shell-based?

Emulsion polymerization is discovered to be the most popular encapsulation method for poly(styrene) shell-based MPCMs due to its simplicity of synthesis, absence of toxic organic solvents, and capacity to produce polymeric shells with desired mechanical properties along with the inexpensive nature of synthesis.

What is the degree of supercooling of hexadecane-based emulsion?

In addition, through an experiment using a DSC to measure the degree of supercooling, it was found that the degree of supercooling of hexadecane-based emulsion was 17 K. The latent heat of tetradecane-based emulsion is indicated to be 19.3 kJ/kg for 10 mass emulsion and 73.3 kJ/kg for 40 mass% one at 5.9 °C in this research.
