Are energy storage and return feet suitable for moderate activity?

Three examples of energy storage and return feet (suitable for moderate activity) were selected and randomly evaluated: the Blatchford's Epirus,Össur Assure and College Park Tribute feet. The power at the anatomical and mechanical ankle joints was integrated to evaluate the work done over the gait cycle.

What are energy-storage-and-return (ESR) prosthetic feet?

Energy-storage-and-return (ESR) prosthetic feet are commonly prescribed for individuals capable of community ambulation.

Do energy storage and return feet promote metabolically efficient amputee gait?

Energy storage and return (ESR) feet have long been assumed to promote metabolically efficient amputee gait. However, despite being prescribed for approximately 30 yr, there is limited evidence that they achieve this desired function.

Are energy storage and return foot prostheses a viable alternative for amputees?

Energy Storage And Return (ESAR) foot prostheses provide an alternative help improve gait and minimize metabolic energy expenditure during the walking phase of amputees. This study used 3 designs with models from the Catia V5 Software.

Energy storage and return feet are specialized prosthetic components designed to capture energy during activities like walking or running and then release that energy to assist with movement.
