As a result, data center developers are working toward innovative solutions to meet the growing energy demands of their facilities while also reducing their carbon footprint. Battery Energy Storage Systems (BESS) are emerging as a critical component of modern data center infrastructure.

Why do data centers need energy storage?

Backup Power: In the event of an outage, BESS can provide backup power to keep data centers operational, minimizing downtime and data loss. As data center developers face the newer challenges of AI and the processing needs of larger applications, energy storage will play an increasing role in providing reliability and sustainability.

What is a battery energy storage system?

Battery Energy Storage Systems (BESS) are emerging as a critical component of modern data center infrastructure. By providing service to your operation's power grid, as well as secondary backup support, BESS can help improve energy reliability while reducing the reliance on fossil fuels.

How much energy does a data center consume?

A data center consumes about as much energy in a year as 500,000 homes. A large percentage of this power is used for cooling the servers. Using solar panels to heat up water for this purpose could make a big dent in data center energy usage.

Why do data centers need a backup generator?

The exponential growth of "hyperscale" data centers has generated an increased demand for reliable energy. Traditional energy storage solutions, such as uninterruptible power supplies (UPS) with battery backup, can be limited in their capacity and can only provide a few minutes of power before the facility has to switch to backup generators.
