

Is PEI-BNNS a high-temperature energy storage material?

The results show that the obtained PEI-BNNS/PP- y wt % HfO<sub>2</sub> /PEI-BNNS composite (abbreviated as BHB-y) is a promising high-temperature energy storage material. BHB-3 achieves the highest Ud of 12.01 J/cm<sup>3</sup> and  $\eta$  of 91.05% at a high temperature (150°C).

What is thermal energy storage?

Thermal energy storage is a method that transforms electricity into heat and stores it for later use. These systems can connect cheap but intermittent renewable electricity with heat-hungry industrial processes, dispatching the stored energy as needed. Rondo Energy is one of the companies working to produce and deploy thermal batteries.

How does a heat storage system work?

A heat storage system, such as the one developed by the company, works by first transforming electricity into heat using a resistance heater. This heat is then used to warm up carefully engineered and arranged stacks of bricks, which store the heat for later use.

Does a hysteresis loop improve energy storage performance?

The shape of the hysteresis loop before and after the fatigue test is almost identical for two composites at 150°C, indicating that the polarization intensity of the material maintains excellent stability during repeated charging and discharging. The variation in energy storage performance with cycle count is seen in Figures S23 and 2 D.

Is BHB-3 a reliable energy storage system?

This result shows that the BHB-3 composite can maintain the stability and reliability of its energy storage performance, whether in the short or long working cycle. This excellent performance offers firm support and assurance for its general promotion and deployment in practical applications.

What are the energy storage parameters of the BHB composite?

In addition, the whole energy storage parameters of the BHB composite--which was created by concurrently loading the BNNSs onto PEI and HfO<sub>2</sub> nanoparticles onto the PP layer in the PPP composite--were further enhanced to a great extent. In particular, its Ud value increased by two times compared with PEI, and the  $\eta$  value remained above 90%.
