What is a 4 kW multilevel inverter demonstration board?

In this section, we introduce a 4 kW, five-level single-phase flying-capacitor-based active neutral point clamped multilevel inverter demonstration board. This fanless, heatsink-free design offers more than 99 percent peak efficiency and full power efficiency as of 98.7 percent.

How does a grid tie inverter work?

When using a grid-tie inverter, it is connected to the AC output as well. When grid power is available, the battery will be charged with power from both the grid and the PV. Loads are powered from PV when that power source is available. Feed-in is optional and can be enabled or disabled depending on local regulations.

What type of inverter/charger does the energy storage system use?

The Energy Storage System uses a MultiPlus or Quattro bidirectional inverter/charger as its main component. Note that ESS can only be installed on VE.Bus model Multis and Quattros which feature the 2nd generation microprocessor (26 or 27). All new VE.Bus Inverter/Chargers currently shipping have 2nd generation chips.

How do I feed-in PV power via an MPPT solar charger?

Feed-in of PV power via an MPPT Solar Charger can be enabled or disabled in the Energy Storage Systems menu on the CCGX. For grid-tie inverters, the only option is to use a Fronius grid-tie inverter and use the Fronius Zero Feed-in function. See chapter 2.1.3.

How to improve efficiency and power density of single-phase inverters?

Recently, engineers have focused on two different approaches to improve efficiency and power density of single-phase inverters to even higher levels. One is replacing IGBT and Si SJ MOSFETs with wide-bandgap devices like SiC MOSFETs.

How efficient is a multilevel inverter?

The maximum efficiency is achieved at around 2 kW (~ 99.1 percent). At full load (4 kW), the efficiency is still very high, at around 98.7 percent, which explains why this multilevel inverter can work continuously without the need for any heatsink or fan.
