A scaled-up form of firebrick E-TES, referred to hereon as "firebrick resistance-heated energy storage" (FIRES) [13], [14], is a promising option for capturing and transferring surplus low-price electricity to the industrial heating market, or for installation in power plants for regeneration of electricity.

The strong increase in energy consumption represents one of the main issues that compromise the integrity of the environment. The electric power produced by fossil fuels still accounts for the fourth-fifth of the total electricity production and is responsible for 80% of the CO₂ emitted into the atmosphere [1]. The irreversible consequences related to climate change have ...
