What are the recovery technologies for medium and high temperature waste heat?

The recovery technologies for the medium and high temperature waste heat are well evolved, e.g., the heat capture of medium-temperature (350 °C) exhaust gasses, from a kiln hood clinker cooler and kiln tail preheater, using a boiler, and Coke Dry Quenching (CDQ) technology for the recovery of high-temperature (1000 °C) heat of hot coke.

How do waste heat recovery units work?

Waste Heat Recovery Units (WHRUs) work by recovering the thermal energy from the hot exhaust and gases discharged by industrial equipmentsuch as incinerators and turbines. This energy is then repurposed to heat other media and materials,including asphalt and oil. WHRUs are available in various designs and styles.
