What is flywheel kinetic energy recovery system?

A Flywheel Kinetic Energy Recovery System (KERS) is a form of a mechanical hybrid system in which kinetic energy is stored in a spinning flywheel. This technology is being trialled by selected bus, truck, and mainstream automotive companies. Flywheel storage systems can supply instantaneous high power for short periods of time.

What makes flywheel energy storage systems competitive?

Flywheel Energy Storage Systems (FESSs) are still competitive for applications that need frequent charge/discharge at a large number of cycles. Flywheels also have the least environmental impact amongst the three technologies, since it contains no chemicals.

What is a flywheel/kinetic energy storage system (fess)?

A flywheel/kinetic energy storage system (FESS) is a type of energy storage system that uses a spinning rotor to store energy. Thanks to its unique advantages such as long life cycles, high power density, minimal environmental impact, and high power quality such as fast response and voltage stability, FESS is gaining attention recently.

What is a flywheel and how does it work?

A flywheel is an onboard energy recovery and storage system that is durable, efficient, and environmentally friendly. It works by storing energy in a rotating mechanical device, the flywheel. The temperatures of the flywheel and its housing can be influenced by the friction-induced windage losses in the air-gap of a high-speed rotating flywheel.

How can flywheels be more competitive to batteries?

To make flywheels more competitive with batteries, the use of new materials and compact designs can increase their specific energy and energy density. Additionally, exploring new applications like energy harvesting, hybrid energy systems, and secondary functionalities can further enhance their competitiveness.
