

Explosion-proof fan control box for energy storage container

Does a lithium-ion energy storage unit need explosion control?

To address the safety issues associated with lithium-ion energy storage, NFPA 855 and several other fire codes require any BESS the size of a small ISO container or larger to be provided with some form of explosion control. This includes walk-in units, cabinet style BESS and buildings.

How can CFD be used in explosion prevention systems containing exhaust systems?

CFD methodology can assist with the performance-based design of explosion prevention systems containing exhaust systems. CFD is a simulation tool that produces predictions of fluid-flow phenomena based on the laws governing fluid motion (i.e., mass, momentum, and energy).

Can explosion prevention systems mitigate gas concentrations according to NFPA 69 standards?

Simulations are often preferred to determine if an explosion prevention system can effectively mitigate gas concentrations according to NFPA 69 standards. CFD methodology can assist with the performance-based design of explosion prevention systems containing exhaust systems.

What are the different types of explosion protection systems?

Although Passive Protection (explosion venting) is the most common protection method, Active Explosion Protection Systems are available which incorporate detection, control and monitoring, and suppression to instantaneously quench the incipient explosion before it reaches a dangerous state.

Does NFPA 855 require explosion control?

NFPA 855 [*footnote 1], the Standard for the Installation of Stationary Energy Storage Systems, calls for explosion control in the form of either explosion prevention in accordance with NFPA 69 [*footnote 2] or deflagration venting in accordance with NFPA 68 [*footnote 3].

Should deflagration venting be used as passive explosion protection?

In general, using deflagration venting as passive explosion protection in addition to an active system has multiple benefits due to the nature of the battery failure event, which involves a rapid release of flammable gases.

When the concentration of fuel gas is higher than the threshold value, the electric louver of the exhaust fan is opened, the explosion-proof fan is opened, and the electric louver of ventilation is opened to discharge the combustible gas in the energy storage box.
