KEYWORDS: Atmospheric storage tanks, catastrophic tank failure, bund overtopping, risk assessment, prevention, control. **INTRODUCTION** Modern design standards for bunds surrounding atmospheric storage tanks should ensure that the bunds are able to contain at least 110% of the maximum volume of the largest tank in a bund.

Despite the successful results presented so far, degradation of the hydrogen storage tank is still being reported [18]. In combination with the load from the hydrogen storage system, the hydrogen will diffuse into the metal lattice, causing cracks that will eventually lead to fractures and the failure of the hydrogen storage tank.
