What are the costs associated with a power plant?

The variable costs associated with a power plant include rehabilitation or repairs to welding joints, circuit breakers, and runners. ORNL estimated unit start cost in the \$300-\$1,000 range. Assuming the plant is sized at 100 MWh, and goes through 20 cycles in a year, this amounts to the 0.000094 to 0.0003 cents/kWh range.

What is the cost of pumped storage?

Pumped storage, when compared on an energy basis, offers a very low cost of \$19/kWh-yr using 2018 values, as shown in Figure 5.3. This cost is significantly lower than that of battery storage technologies.

What are the licensing costs for the first solar power plant?

Licensing costs for the first system are estimated to be \$3 million, with costs reduced to \$1 million for all subsequent plants. The cost of the plant is estimated to be \$22.3 million or \$4,400 kW (\$743/kWh). SENA has estimated a two-year project development cycle consisting of licensing activities in Year 1 and capital costs in Year 2.

How much does energy storage cost in 2025?

The red diamonds in the figure provide a forecasted cost for each energy storage technology for the year 2025 on a \$/kWh-yr basis. Pumped storage is forecasted to cost \$19/kWh-yr in 2025 when compared on an energy basis using 2018 values.

How are battery energy storage costs forecasted?

Forecast procedures for battery energy storage costs are described in the main body of this report. C&C or engineering, procurement, and construction (EPC) costs can be estimated using the footprint or total volume and weight of the battery energy storage system (BESS). For this report, volume was used as a proxy for these metrics.
