

How do I evaluate potential revenue streams from energy storage assets?

Evaluating potential revenue streams from flexible assets, such as energy storage systems, is not simple. Investors need to consider the various value pools available to a storage asset, including wholesale, grid services, and capacity markets, as well as the inherent volatility of the prices of each (see sidebar, "Glossary").

How to calculate energy storage investment cost?

In this article, the investment cost of an energy storage system that can be put into commercial use is composed of the power component investment cost, energy storage media investment cost, EPC cost, and BOP cost. The cost of the investment is calculated by the following equation: (1) $CAPEX = C_P \cdot Cap + C_E \cdot Cap \cdot Dur + C_{EPC} + C_{BOP}$

What factors are taken into account when calculating the energy storage system?

In this section, the following factors are taken into account including the electricity sales of wind-storage system, the reserve ancillary services of the energy storage system, and the investment cost of the energy storage system. The value of spinning / non-spinning reserve service is set as 2.25 \$/MW per hour.
