The storage state ($S_L(t)$), at a particular time t , is the sum of the existing storage level ($S_L(t-1)$) and the energy added to the storage at that time ($E_S(t)$); minus the storage self-discharge, d , at $(t-1)$ and the storage discharged energy ($E_D(t)$), at time t . Energy losses due to self-discharge and energy efficiency (i) are also taken ...
