What is the current installed capacity of pumped storage hydropower?

According to the International Hydropower Association (IHA), PSH is the largest form of renewable energy storage, with an installed capacity of nearly 200 gigawatts. Recent studies suggest there is significant potential for scaling up global pumped hydro capacity, including from more than 600,000 identified off-river sites.

How does pumped storage hydropower work?

PSH acts similarly to a giant battery, because it can store power and then release it when needed. The Department of Energy's "Pumped Storage Hydropower" video explains how pumped storage works. The first known use cases of PSH were found in Italy and Switzerland in the 1890s, and PSH was first used in the United States in 1930.

What is pumped storage hydropower (PSH)?

Pumped storage hydropower (PSH) is the world's largest battery technology, accounting for more than 90% of long-duration energy storage globally, surpassing lithium-ion and other battery types. PSH is a closed-loop system with an 'off-river' site that produces power from water pumped to an upper reservoir without a significant natural inflow.
