

How to automatically store energy in a universal energy storage circuit breaker

10.2.4.1 Circuit breaker. A circuit breaker is an automatically operated electrical switch designed to protect an electrical circuit from the damage caused by the excess current from an overload or short circuit. Unlike fuse, which operates once and then must be replaced, a CB can be reset to resume normal operation. The function of a circuit breaker is to interrupt or close all currents ...

The switch mechanism is used to manually turn the circuit on and off, while the trip unit is responsible for detecting faults and triggering the circuit breaker to open. When a short circuit or overload occurs, the trip unit automatically sends a signal to the switch mechanism to open the circuit breaker and stop the flow of electricity.

Beyond mechanical storage, universal circuit breakers engage in electrical energy transformation, converting stored mechanical energy into effective circuit interruption. When the circuit breaker detects an overload, the mechanical energy held in the spring is released.

Chemical energy storage systems (CES), which are a proper technology for long-term storage, store the energy in the chemical bonds between the atoms and molecules of the materials [].This chemical energy is released through reactions, changing the composition of the materials as a result of the break of the original chemical bonds and the formation of new ones [].

The so-called energy storage means that when the circuit breaker is de-energized (that is, when it is opened), it opens quickly due to the spring force of the energy storage switch. Of course, the faster the circuit breaker is opened, the better. This is to have enough power to separate the contacts when the segmentation fault has a large current (excessive current will ...

An anti-jamming device for an energy storage handle of a universal circuit breaker comprises a circuit breaker body, and an operating mechanism mounted on one side of the circuit breaker body. The energy storage handle is mounted on the outside wall of one side of the operating mechanism. The energy storage handle is rotated to manually store energy for the operating ...

It is also found that the energy storage efficiency is independent on the value of the capacitance, but related to the voltage of the capacitor. In the actual charging test, 57.8% energy storage efficiency can be achieved. By optimizing the parameters, the maximum energy storage efficiency is achieved by selecting a L of 10 mH. And the stored ...
