How to determine the initial energy storage of the circuit

What is a first order circuit?

Hence,the circuits are known as first-order circuits. A first-order circuit is characterized by a first-order differential equation. The energy is initially stored in the capacitive of inductive elements. The energy couses the current to flow in the circuit and gradually dissipated in the resistors.

What is a first order RC circuit?

A first-order circuit is characterized by a first-order differential equation. The energy is initially stored in the capacitive of inductive elements. The energy couses the current to flow in the circuit and gradually dissipated in the resistors. A source-free RC circuit occurs when its dc source is suddenly disconnected.

How do you find inductor current i 0?

Goal - find the inductor current i as the circuit response. The natural response dies out after five time constants - the inductor becomes a short circuit and the voltage across it is zero. 0 be the initial current through the inductor. (vi) Find the initial inductor current, i (0) . - obtain from the given circuit for t < 0 .

How do you find the time constant of a circuit?

To find the time constant of a first-order RC or RL circuit,use Kirchhoff's laws and KLV. The product RC or RL has the unit of time (seconds). This product is called the time constant of the circuit and is often assigned the variable t = RC or RL.

How do you determine a source-free RL circuit?

t=100ms. Determine the time at which the capacitor voltage is 10V. A source-free RL circuit occurs when its dc source is suddenly disconnected. The energy already stored in the inductor is released to the resistors. By definition,$v_L = L\, di/dt$ and $v_R = Ri$. Thus,

What is the difference between a first-order circuit and a source-free circuit?

A first-order circuit can only contain one energy storage element (a capacitor or an inductor). The circuit will also contain resistance. A first-order circuit is characterized by a first-order differential equation. A source-free circuit is one where all independent sources have been disconnected from the circuit after some switch action.
