What is a liquid-cooled battery energy storage system (BESS)?

High-power battery energy storage systems (BESS) are often equipped with liquid-cooling systems to remove the heat generated by the batteries during operation. This tutorial demonstrates how to define and solve a high-fidelity model of a liquid-cooled BESS pack which consists of 8 battery modules, each consisting of 56 cells (14S4p).

Can a liquid cooling plate be embedded with PCM?

Besides, a liquid cooling plate (LCP) embedded with PCM was proposed by Akbarzadeh et al., both the energy consumption and weight were reduced by 30 % and 36 % respectively compared with traditional LCP, but  $\Delta T$  was 4.6 K, which was close to the critical value of 5 K.

Does delayed liquid cooling reduce power consumption?

During the 1C-charging and 4C-discharging cycles, the  $T_{max}$  of BTMS with normal strategy remains at 319.5 K and  $\Delta T$  lower than 3 K; furthermore the strategy of delayed liquid cooling can significantly reduce power consumption by 33.3 % without sacrificing the cooling performance.

How does a PCM control the temperature of a battery module?

The heat generated by battery is first absorbed by the PCM using latent heat, and then is transferred to the wall of the flow channel through heat conduction, subsequently, is removed by the cooling water in the channel, thus temperature control of battery module is achieved.

What is the difference between liquid cooled BTMS and air cooling?

By contrast, the liquid-cooled BTMS offers higher cooling efficiency than air cooling owing to higher heat transfer coefficient and specific heat capacity of the cooling medium, such as water, dielectric fluid, nanofluid and ethylene glycol mixture.

Does BTMS combine PCM with liquid cooling?

Meanwhile, it can be found that  $T_{max}$  of each battery module with PCM still exceeds the critical value of 323.15 K at the mass flow rate of 0 g/s, which means that anticipated cooling performance cannot be attained only through passive PCM-cooling or natural convection cooling; therefore, hybrid BTMS combined PCM with liquid cooling is necessary.
