What is portable hydrogen energy systems?

Portable Hydrogen Energy Systems: Fuel Cells and Storage Fundamentals and Applications covers the basics of portable fuel cells, their types, possibilities for fuel storage, in particular for hydrogen as fuel, and their potential application.

Why are hydrogen and fuel cell used in portable power systems?

Reasons for the application of hydrogen and fuel cell in portable power systems are given. The fuel-cell energy generation concept has fundamental properties that may improve and complement current portable energy generators, mostly batteries, in many consumer applications.

Can hydrogen be used as a portable fuel?

Until recent years, hydrogen has been seldom considered for portable applications due to its low volume and weight energy densities, when including a gas container in the computation, if compared with liquid fuel systems.

How does a hydrogen storage system work?

The system will use battery storage to optimise operations (Renews, 2021). In another example, the Delta Green project in France produces and stores green hydrogen during periods of high renewable energy production, and then converts the hydrogen back into electricity during peak-load hours (Construction21 France, 2018).

What is hydrogen storage & why is it important?

Hydrogen storage offers another source of flexibility for the operation of the energy system in addition to existing sources such as batteries or pumped hydro. Seasonal storage is made possible considering hydrogen can be stored for a short or long term, from hours to months.

What is the most promising fuel for portable fuel cells?

However, recent developments in materials with high hydrogen storage capability, together with the advantages of its fast kinetics and the only emission of water as by-product, have made it the most promising fuel for portable fuel cells at present.

Energy time shift: Hydrogen is used to equilibrate the demand and supply by storing the excess of the energy generated by renewables when the supply is larger than demand and when it is needed, the hydrogen can be used for power generation or grid injection through, for example, stationary fuel cells.
