How does 1200v-class IGBT improve lv100-package performance?

on 1200V-class chips are optimized for the LV100-package chip mount-ing areas. By increasing the IGBT chip area by 39% compared to the 7th genera ion,the 8th generation IGBT signi icantly reduces Rth(j-c) and DC power loss.Figure 6: Output power comparison. Condition : Tvj=150 °C,Vcc=750 V

Can injection-enhanced gate transistors save energy?

Moreover, due to the expansion of renewable energy systems, attention is being focused on injection-enhanced gate transistors (IEGTs), which can play a key role in energy saving for high-voltage DC (HVDC) power transmission systems due to their lower power loss.

What is the difference between a MOSFET and an IGBT?

This is caused by the increase of power dissipated in a MOSFET channel resistance with the square of the current, whereas an IGBT has a near constant saturation voltage, with dissipation consequently just proportional to current.
