

Why is coal a nonrenewable energy source?

Coal is classified as a nonrenewable energy source because it takes millions of years to form. This process involves the transformation of plant material from hundreds of millions of years ago in swampy forests into the combustible black or brownish-black sedimentary rock we know today.

What type of energy is stored in coal?

Chemical energy Potential energy Chemical energy is energy stored in the bonds of atoms and molecules. Batteries, biomass, petroleum, natural gas, and coal are examples of chemical energy. Chemical energy is converted to thermal energy when people burn wood in a fireplace or burn gasoline in a car's engine. What type of energy does coal store?

Why is coal combustible?

Coal is a sedimentary deposit, composed mostly of carbon, making it readily combustible. Millions of years ago, organic material buried within the earth experienced different temperatures and pressure conditions and created fossil fuels. Fossil fuels are non-renewable energy sources, meaning there is a limited amount of these kinds of resources.

How long does it take for coal to form?

Coal is classified as a nonrenewable energy source because it takes millions of years to form. Coal is a combustible black or brownish-black sedimentary rock with a high amount of carbon and hydrocarbons. Coal contains the energy stored by plants that lived hundreds of millions of years ago in swampy forests.

Is coal a combustible rock?

Coal is the most abundant fossil fuel in the United States and the largest energy source for electricity in the world. But what is coal, other than a brownish-black rock that burns? What is Coal? Coal is a sedimentary deposit, composed mostly of carbon, making it readily combustible.
