What is a virtual price of energy storage use under Tou tariff policy?

As will be discussed shortly, under TOU tariff policy, when the grid price is low, the prosumers will choose to purchase electricity from the grid rather than using energy storage to release electricity. In summary, the virtual price of energy storage use is set as $E_{pst-j} = E_{pm} + 0.01$.

Does a PVP policy reduce peak power usage?

An electricity demand model based on household characteristic is presented. The peak-shaving effect of the current PVP policy in 11 provinces is less than 3%. Optimized PVP can significantly reduce peak power usage and increase benefits. The PVP policy needs to be optimized from the price and time period division.

Similar to the pricing of other commodities, traditional electricity pricing methods add some profits on the cost [18]. However, it will lead to many problems such as more administrative interventions, monopoly of state-owned enterprises, lack of competition, low efficiency and difficulties to ensure the rights of consumers [28]. While introducing DR to demand side, ...

The policy also introduced a seasonal pricing mechanism - in January, July, August and December, power prices will be higher than other months. The electricity price during peak and valley periods will increase 80% and decrease 60%, respectively, compared to shoulder electricity prices.

Abrell et al. [35] argue that the optimal policy mix of renewables and energy storage is to subsidize energy storage when the share of renewables is high, and to tax energy storage otherwise. Most existing research has examined the incentive effect of the subsidy policies from a cost-benefit perspective, lacking a consideration of the ...

As far as existing theoretical studies are concerned, studies on the single application of BESS in grid peak regulation [8] or frequency regulation [9] are relatively mature. The use of BESS to achieve energy balancing can reduce the peak-to-valley load difference and effectively relieve the peak regulation pressure of the grid [10].Lai et al. [11] proposed a ...

The difference between electricity price of peak-valley pricing and flat pricing $DK_{type1} = S1_1 - S2_1 = 0.066$ k (yuan/day). For the first type of electrical equipment, peak-valley pricing is more advantageous. 3.3 Electricity Price of the Second Type. The second type of electrical equipment in the base station is air conditioner.

The peak-shaving and valley-filling of power grids face two new challenges in the context of global low-carbon development.
