

Why is water storage important?

Water storage has always been important in the production of electric energy and most probably will be in future energy power systems. It can help stabilize regional electricity grid systems, storing and regulating capacity and load following, and reduce costs through coordination with thermal plants.

Can energy storage solve transboundary water and energy conflict in Central Asia?

A solution for transboundary water and energy conflict in Central Asia is proposed. Benefits of energy storage beyond the energy sector are shown. Long duration energy storage is key for high shares of solar PV and wind energy in the region. An open-access, integrated water and energy system model of Central Asia is developed.

Can water storage be used as energy storage for RES-I?

Water storages as energy storages for RES-I have been analyzed in the literature, and by other authors, but mostly for wind energy and by the author of this paper, PV and ST technology.

Will water storage be energy storage in future EPS?

The analysis of the characteristics of water storage as energy storage in such future EPS is the scope of this paper. Water storage has always been important in the production of electric energy and most probably will be in future energy power systems.

How can a long-duration energy storage system be improved?

Addressing these challenges requires advancements in long-duration energy storage systems. Promising approaches include improving technologies such as compressed air energy storage and vanadium redox flow batteries to reduce capacity costs and enhance discharge efficiency.

What are the benefits of energy storage beyond the energy sector?

Benefits of energy storage beyond the energy sector are shown. Long duration energy storage is key for high shares of solar PV and wind energy in the region. An open-access, integrated water and energy system model of Central Asia is developed. Central Asia's energy transition to a high share of renewable energy by 2050 is analyzed.

Thermal energy storage (TES) based on phase change materials (PCMs) is favored for its inherent high energy storage density and nearly constant phase change temperature [3]. Specifically, TES utilizes the ability of PCMs to absorb or release large amounts of latent heat during the phase change process to store and release cold energy.
