

How a complex energy storage policy system has developed in China?

The development of energy storage industry requires promotion of the government in the aspect of technology, subsidies, safety and so on, thereby a complex energy storage policy system has developed. A lack of systematic research specifically regarding energy storage policies in China still prevails.

What is new energy storage?

New energy storage, or energy storage using new technologies such as lithium-ion batteries, liquid flow batteries, compressed air and mechanical energy, is an important foundation for building a new power system in China, enjoying the advantages of quick response, flexible configuration and short construction periods.

Why are thermal energy storage systems more efficient than latent heat storage systems?

Their energy density is about 5-10 times higher than latent and sensible heat storage systems respectively; their storage period and transport are theoretically unlimited because there is no thermal loss during storage as products can be stored at ambient temperature. 4.4. Thermal energy storage technologies and real life applications

Is there a market mechanism for energy storage in China?

Second, there is still a lack of effective market mechanisms in energy storage industry. At present, the application of energy storage in China is mainly distributed power generation and grid connection of micro-grid and renewable energy. There were few applications of power transmission and distribution and auxiliary services.

How has China developed the energy storage industry?

The Chinese government has promulgated many policies to promote the development of energy storage. The energy storage industry had ushered in a period of development with the release of the 13th Five Year Plan (National Development and Reform Commission, 2016; China Energy Storage Alliance, 2021).
