The proposed control strategy utilizes the reverse power flow to accumulate energy on the storage device, that will be later utilized during lifting trips. Excess recovered energy is injected to the grid. The storage device is controlled to maintain a minimum energy level for emergency situations, to safely guarantee landing of the elevator's cart.

Pumped hydro storage: Water is pumped to a higher elevation, storing gravitational potential energy, which can be released when the water flows back down. Flywheels: A rotating mass stores energy. As the flywheel spins, it stores kinetic energy, which the system can convert to electricity. Compressed air energy storage (CAES): Air is compressed and stored in ...
