Rechargeable batteries are widely regarded as an electrochemical energy storage method to mitigate fossil fuel pollution [1]. However, lithium-ion batteries (LIBs) have nearly reached their energy density limit (theoretically  $390 \text{ Wh kg}^{-1}$ ) [2], making it challenging to meet the increasing demand for higher energy density in portable electronic devices and electric ...

The safety issues of LIBs become more important if high energy density is achieved. It's reported that higher

energy density leads to earlier and more severe thermal runaway reactions [6]. It means that thermal runaway risk of Li metal batteries could be greatly increased compared with conventional LIBs.

To enhance the safety of K metal batteries, a graphite-intercalation-compound of K (K-GIC) is prepared as an anode instead of K metal in this work. The K-GIC symmetric batteries show excellent cycling stability due to suppressing dendrite and alleviating volume expansion which are resulted from the interlayer insertion/extraction mechanism and ...

To realize the superiority of lithium metal batteries, several requirements should be ensured. First, desirable endurance for high current density ( $>3 \text{ mA cm}^{-2}$ ) is needed for high rate performance. Second, high areal capacity loading of over  $2 \text{ mA h cm}^{-2}$  is the prerequisite for commercial use. Third, long cycling lifetime and dendrite-free anode are the guarantees of ...
