Can mobile energy storage systems improve resilience in post-disaster operations?

Distributed energy resources, especially mobile energy storage systems (MESS), play a crucial role in enhancing the resilience of electrical distribution networks. However, research is lacking on pre-positioning of MESS to enhance resilience, efficiency and electrical resource utilization in post-disaster operations.

Are mobile energy storage systems ambiguous?

There is also ambiguity in available technologies and vendor products that can be reliably used in mobile energy storage applications. In that regard, the design, engineering and specifications of mobile and transportable energy storage systems (ESS) projects will need to be investigated.

What is mobile energy storage system?

The primary application of mobile energy storage systems is for replacement of polluting and noisy emergency diesel generators that are widely used in various utilities, mining, and construction industry. Mobile ESS can reduce use of diesel generators and provide a cleaner and sustainable alternative for reduction of GHG emissions.

How can mobile energy storage systems be improved?

Establishing a pre-positioning method for mobile energy storage systems. Modeling flexible resources and analyzing their supply capabilities. Coordinating the operation of mobile energy storage systems with other flexible resources. Enhancing the resilience of the distribution network through bi-level optimization.

What are mobile energy storage systems (mess)?

Among them, mobile energy storage systems (MESS) are energy storage devices that can be transported by trucks, enabling charging and discharging at different nodes.

Can mobile energy storage systems be pre-allocated on a short-time scale?

The main contributions of this paper are summarized hereafter: (1) Propose a novel method to pre-allocate mobile energy storage systems on a short-time scale. This allows the MESS to quickly participate in post-disaster load recovery, reducing loss of load and improving the efficiency of the MESS.

The rapid growth of battery electric vehicles (BEVs) usage causes severe challenges for charging infrastructure. Despite the numerous merits of stationary energy ...
