

What is molecular solar thermal energy storage?

Molecular solar thermal energy storage systems (MOST) offer emission-free energy storage where solar power is stored via valence isomerization in molecular photoswitches. These photoswitchable molecules can later release the stored energy as heat on-demand. Such systems are emerging in recent years as a vibrant

Can molecular solar energy be stored in strained isomeric structures?

Recent advances in the design of molecular have opened up opportunities for storing solar energy in strained isomeric structures and releasing heat on demand, culminating in molecular solar thermal (MOST) energy storage densities over  $0.3 \text{ MJ kg}^{-1}$  and validating the potential for achieving thermal

Can molecular photoswitches be used in solar thermal energy storage?

The calculated energy densities of the dimer and trimer systems of up to  $927 \text{ kJ kg}^{-1}$  ( $257 \text{ Wh kg}^{-1}$ ) and measured densities up to  $559 \text{ kJ kg}^{-1}$  ( $155 \text{ Wh kg}^{-1}$ ) greatly exceed the original targets of  $300 \text{ kJ kg}^{-1}$   $15$  highlighting the potential of applying molecular photoswitches in future solar thermal energy storage technologies.

What are solar thermal batteries based on?

The solar thermal batteries based on MOST compounds will enable a solar-chargeable, off-grid, and long-term energy storage in light-weight organic materials that are easily produced from low-cost feedstocks, complementing the state-of-the-art energy conversion and storage technologies.

Can solar energy be stored based on a reversible chemical reaction?

A device for solar energy storage and release based on a reversible chemical reaction is demonstrated. A highly soluble derivative of a (fulvalene)diruthenium ( $\text{FvRu } 2$ ) system is synthesized, capable of storing solar energy ( $110 \text{ J g}^{-1}$ ) in the form of chemical bonds and then releasing it "on demand", when excited thermally or catalytically.

How will a hybrid solar energy system work?

The molecular system will capture solar energy at room temperature and store it for long periods of time without significant losses. Combined with thermal energy storage, the hybrid system will make efficient and on-demand use of solar energy possible. Two modes of operation will be possible.

The MOST project aims to develop and demonstrate a zero-emission solar energy storage system based on benign, all-renewable materials. The MOST system is based on a molecular system that can capture solar energy at room temperature and store the energy for very long periods of time without remarkable energy losses. This corresponds to a closed cycle of energy capture, ...

Several methods for storing solar energy, such as the use of electrochemical batteries, hydrogen energy storage, and carbon dioxide conversion, are being implemented. 5 A relatively unexplored method is the ...

An international research team led by the Universitat Politècnica de Catalunya -- BarcelonaTech (UPC), with researchers from Chalmers, has created a hybrid device that combines, for the first time ever, molecular solar ...

Recent advances in the design of molecular photoswitches have opened up opportunities for storing solar energy in strained isomeric structures and releasing heat on ...

A promising approach for solar energy harvesting and storage is the concept of molecular solar thermal energy storage (MOST) systems also known as solar thermal fuels (STF). Solar energy is used to drive the chemical reaction of a ...

The energy storage mechanism of azobenzene is based on the transformation of molecular cis and trans isomerization, while NBD/QC, DHA/VHF, and fulvalene dimetal complexes realize the energy storage function by changing the molecular structure. Acting as "molecular batteries," they can exhibit excellent charging and discharging behavior by ...

Thermal energy can be used for a broad range of applications such as domestic heating, industrial process heating and in thermal power processes. One promising way to store solar thermal energy is so-called molecular solar thermal (MOST) energy storage systems, where a photoswitchable molecule absorbs

The EU-funded MOST project therefore aims to create a zero-emission solar energy storage system based on all-renewable materials. The molecular system will capture solar ...

Self-activated energy release cascade from anthracene-based solid-state molecular solar thermal energy storage systems. ... Intermolecular London Dispersion Interactions of Azobenzene Switches for Tuning Molecular Solar Thermal Energy Storage Systems. ChemPlusChem, 84 (2019), pp. 1145-1148, 10.1002/cplu.201900330. View in Scopus Google ...

Molecular solar thermal (MOST) systems combine solar energy conversion, storage, and release in simple one-photon one-molecule processes. Here, we address the electrochemically triggered ...

1 Introduction 1.1 Molecular Solar Thermal (MOST) Systems. The primary energy demand is expected to increase by about 1 % per year up to 2030 reaching 485 EJ for the world consumption in the Stated Policies Scenario. 1 ...

A device for solar energy storage and release based on a reversible chemical reaction is demonstrated. A highly soluble derivative of a (fulvalene)diruthenium (FvRu<sub>2</sub>) system is synthesized, capable of storing solar energy (110 J g<sup>-1</sup>) in ...

Molecular solar thermal (MOST) systems have attracted tremendous attention for solar energy conversion and

storage, which can generate high-energy metastable isomers upon capturing photon energy, and ...

This layer employs a molecular solar thermal (MOST) energy storage system to convert and store high-energy photons--typically underutilized by solar cells due to thermalization losses--into chemical energy. Simultaneously, it effectively cools the PV cell through both optical effects and thermal conductivity.

energy system beyond fossil fuels, however necessitates new scalable technologies for solar energy storage. One approach is the development of energy storage systems based on molecular photoswitches, so-called molecular solar thermal energy storage (MOST). By using organic

Molecular solar thermal (MOST) systems that undergo photoisomerizations to long-lived, high-energy forms present one approach of addressing the challenge of solar energy storage. For this approach to ...

The MOST project aims to develop and demonstrate a zero-emission solar energy storage system based on benign, all-renewable materials. The MOST system is based on a molecular system ...

The efficiency of photovoltaic (PV) solar cells can be negatively impacted by the heat generated from solar irradiation. To mitigate this issue, a hybrid device has been developed, featuring a solar energy storage and ...

The concept of molecular solar thermal (MOST) storage systems is based on capturing solar energy via photoisomerization, which can be released later as thermal energy. Generally, suitable compounds are irradiated and ...

A considerable number of molecular solar thermal (MOST) systems incorporating organic compounds, including anthracene 9,10, azobenzene 11,12,13, dihydroazulene 14,15, norbornadiene-quadracycline ...

Recent advances in the design of molecular photoswitches have opened up opportunities for storing solar energy in strained isomeric structures and releasing heat on demand, culminating in molecular solar thermal (MOST) energy storage densities over 0.3 MJ kg<sup>-1</sup> and validating the potential for achieving thermal battery applications.

In the research paper " Hybrid solar energy device for simultaneous electric power generation and molecular solar thermal energy storage, available in Joule, the team explains the MOST system is ...

Several properties of the MOST systems are strongly correlated, e.g. addition of larger substituents to improve E<sub>nm</sub> leads to an increase in the molecular weight, thus lowering the energy storage density. That is why there is still room for improvement in molecular design, even though the concept was conceived as early as 1909. 6 Yet, it is still very challenging to ...

The energy storage density of the MOST systems is higher than most latent heat energy storage systems, and can reach an energy density of up to 1 MJ/kg. [14] A potential benefit of the MOST systems for applications is

that the MOST molecules change their chemical state throughout charging and discharging cycles but not the phase (unlike PCM).

The MOST project aims to develop and demonstrate a zero-emission solar energy storage system based on benign, all-renewable materials. The MOST system is based on a molecular system that can capture solar energy at room temperature and store the energy for very long periods of...

The electrocyclic reactions, as represented by the norbornadiene (NBD)/quadricyclane (QC) couple, show promise for solar thermal storage due to their high storage enthalpy, low molecular weight, and availability. 25-27 ...

1 Universidad de Alcalá, Departamento de Química Analítica, Química Física e Ingeniería Química, Alcalá de Henares, Madrid, Spain; 2 Universidad de Alcalá, Instituto de Investigación Química "Dr. M. del Río" ...

For molecular solar thermal (MOST) systems, the energy storage density, energy conversion efficiency, and energy storage time are the major figures of merit, which can be optimized by the judicious molecular designs and fine-tuning their optical and thermal properties (Figure 1 B). A large energy storage density can be acquired by designing switches of small ...

Since then, several molecular photoswitchable systems have been developed. Together, these systems have been referred to as molecular solar thermal systems (MOST) or solar thermal fuels. 9, 10 In this review, we introduce the working principles of a MOST system and discuss the energy storage performance of the most studied molecular systems ...

Isomere speichern Solarenergie. Das Molecular Solar Thermal Energy Storage System (MOST) nutzt ein Molekül aus Stickstoff, Kohlenstoff und Wasserstoff. Wenn dieses mit Sonnenlicht bestrahlt wird, ordnet es zu einem ...

Molecular photoswitches can be used for solar thermal energy storage by photoisomerization into high-energy, meta-stable isomers; we present a molecular design ...

The development of solar energy can potentially meet the growing requirements for a global energy system beyond fossil fuels, but necessitates new scalable technologies for solar energy storage. One approach is the development of ...
