

Monkeys can store electricity in their mouths

Which monkeys have cheek pouches?

Old World Monkeys have cheek pouches that allow them to store extra food within their mouths that they can eat later. Prehensile tails are physical adaptations found in New World monkeys such as spider monkeys and gibbons, which acts as an extra limb to keep their hands free while foraging for food.

How do monkeys store food?

Unlike some animals, monkeys lack a specialized pouch or crop to store food temporarily. Instead, their food moves directly into the stomach for further processing. The monkey's stomach is a fascinating organ. It has a highly acidic environment, which aids in the breakdown of proteins and kills any harmful bacteria that may be present in the food.

What physical attributes help monkeys collect food?

Monkeys have also evolved some physical attributes to help them forage and collect food and these include prehensile tails in New World monkeys and cheek pouches for Old World monkeys. In their natural habitat, monkeys eat a wide range of food and these include fruits, flowers, plants, grass, insects, spiders, bird eggs and small animals.

Why does a monkey have a stomach?

The monkey's stomach is a fascinating organ. It has a highly acidic environment, which aids in the breakdown of proteins and kills any harmful bacteria that may be present in the food. This is crucial for the monkey's health, as it allows them to consume a wide range of foods without falling ill.

How does the monkey digestive system work?

Now that we've explored the monkey digestive system, it's clear that these creatures have a finely tuned mechanism for extracting nutrients from their food. From the mouth to the anus, each organ plays a vital role in ensuring the monkey's survival in its natural habitat. But our journey doesn't end here.

How do monkeys eat?

Our adventure begins in the monkey's mouth, where the digestion process kicks off. Monkeys have a set of sharp incisors and canines, perfect for tearing into fruits, leaves, and even insects. They also possess molars at the back of their mouth for grinding tough plant material. Once the food is sufficiently chewed, it's time to swallow.
