What is mutual inductance?

In other words, the mutual inductance is the geometric mean of the self inductances. An ideal mutual inductor is made from a primary coil of inductance 5m0 and a secondary coil of inductance 10m0. Find the value of the Mutual Inductance. A mutual inductor has two coils tightly wound over each other.

What is mutual inductance M12?

Mutual inductance M12 is the link that exists between the flux circulating in a coil 1 generated by the circulation of a current i2 in a coil 2: This is more general than cases of self-inductance, and is essential for understanding the operation of multiple coils on a shared magnetic circuit, such as those used in flyback or forward transformers.

What is a maximum mutual inductance?

A maximum mutual inductance is reached with the linking flux of one coil entirely pass through the second coil. This may occur when two coils are concentric, e.g., one coil is wrapped around the other. As the geometries move away from each other, the linking flux between the coils is reduced. The ratio of is a factor $0 \le k \le 1$.

What causes mutual inductance in a stationary circular coil?

When an electrical component, such as a coil, interacts with or is influenced by the magnetic field in a neighboring component, mutual inductance is said to occur. The current flowing in one coil induces an emf in the neighboring coil. What is the induced emf in a stationary circular coil kept in a uniform magnetic field?
