

What is energy security?

At the country level, energy security is based on the availability of all energy consumption requirements at all times from indigenous sources or imports and from stocks. Normally in most new and diversified pipeline routes, and imports, countries, this is a state responsibility.

What role does the state play in energy security?

This role is prominent in most OECD countries, modest in some developing countries, and absent in others, where the state remains almost solely responsible for the energy market and the security of supplies and services. In a globalised market economy, energy security becomes a matter of prices, economic growth rates, and wealth transfers.

What are the aims of energy security?

Present energy security aims go beyond merely ensuring the other governments in such arrangements. availability of abundant oil supplies at affordable prices. They Collecting and disseminating accurate energy market information also include ensuring long-term energy adequacy in a new economic in the event of emergencies.

Why should energy security be investigated?

Energy security needs to be investigated at several levels: globally, to ensure adequacy of resources; regionally, to ensure that networking and trade can take place; at the country level, to ensure national security of supply; and at the consumer level, to ensure that consumer demand can be satisfied.

Why is redefining the political dimension of energy security important?

That requires redefining the political dimension of energy security. Markets clearly produce benefits for consumers: trade, innovation, cost reduction, technological advances, and better allocation of resources. Moreover, unbundling the supply chain enhances transparency and allows tariffs to reflect real costs.

Are energy supplies good prospects for energy security in the 21st century?

In short, the world's energy supplies offer good prospects for energy security in the 21st century. The fossil fuel reserves amount to 1,300 Gtoe and the fossil fuel resource base to around 5,000 Gtoe (see table 4.1), amounts sufficient to cover global requirements throughout this century, even with a high-growth scenario.
